

$$\text{with } d_1 = \frac{Y + K_i - X_i}{\sigma \sqrt{t}} \sqrt{\frac{1}{2}} \sqrt{\frac{1}{2}}$$

Then, $G(X_t; Y_t; t; T)$ is equal to:

$$G(X_t; Y_t; t; T) = \frac{1}{\sigma \sqrt{t}} \exp\left(-\frac{1}{2} d_1^2\right) \left[\frac{1}{\sigma \sqrt{t}} \exp\left(-\frac{1}{2} d_1^2\right) + \frac{1}{\sigma \sqrt{t}} \exp\left(-\frac{1}{2} d_1^2\right) \right]$$

Using the fact that $\int_{-\infty}^{\infty} f(u) \exp(-a + bu) du = \exp\left(-\frac{a}{1+b^2}\right)$; this becomes:

$$G(X_t; Y_t; t; T) = \frac{1}{\sigma \sqrt{t}} \exp\left(-\frac{1}{2} d_1^2\right) + \frac{1}{\sigma \sqrt{t}} \exp\left(-\frac{1}{2} d_1^2\right)$$

and consequently the price of a call is equal to:

$$C(r_t; X_t; Y_t; t; T) = B(r_t; t; T) \left[\frac{1}{\sigma \sqrt{t}} \exp\left(-\frac{1}{2} d_1^2\right) + \frac{1}{\sigma \sqrt{t}} \exp\left(-\frac{1}{2} d_1^2\right) \right]$$
